TABEX4 WINDOWS CLIENT/SERVER

TABEX4

TABEX4 is the leading cross-platform standard software for table access and maintenance. Highest performance and convenient data maintenance make TABEX4 an optimal tool for efficient and revision-proof table management.

TABEX4 WINDOWS CLIENT/SERVER

TABEX4 Windows Client/Server enables to access centrally maintained TABEX databases and data spaces via decentralized Windows clients.

Your advantages

The desired TABEX databases and data spaces are replicated from the Mainframe to the Windows client. They can be accessed by various programming environments, such as COBOL, PL1, C/C++, Visual Basic etc. The replication can be executed periodically or event-based.

TABEX4 Windows Client/Server is ideal for employees that can't access the local area network constantly (e.g. account manager and sales representatives) and developers that need to access TABEX but can't access the mainframe constantly. A permanent migration from the mainframe to a decentralized environment is possible as well.

The advantages:

- Remarkably high performance
- The central processor is unloaded
- Autonomic offline access

Any number of Windows clients can be provided with all necessary data.

BETTER ORGANIZED INFORMATION.
